

ADDITIONAL NOTES ON THE GENUS VERBENA. XXVI

Harold N. Moldenke

VERBENA OFFICINALIS L.

Additional bibliography: Sweet, Hort. Brit., ed. 1, 1: 325 (1826) and ed. 3, 553, 1839; Moldenke, Phytologia 36: 221, 235, & 247--250. 1977.

Additional vernacular names reported for this species are "érbo dé mèrvèyo", "érbo dé Nouéstro-Damo", "erculania", "erva de la mivusa" [=jaundice-herb], "escalaurus", "eseberus", "exuperans", "exupra matricalis", "eysenchrawl", "ferria", "flegwurt", "fleur de madame", "gerabotannum", "gerobotanis", "grünkraut", "hardiizer", "herba saginalis", "herba sancti Johannis", "herba sanguinalis", "herba verminata", "herbe à la croix", "herbe à tous maux", "herbe au chat", "herbe de l'effort", "herbena", "herculana", "hiera", "hierobotannum", "hraetelwyrt", "iiserhard", "iiserkruid", "isanina", "isarna", "iserenhard", "isinina", "isnwurze", "Juno's teares", "kerckkruide", "kroazik", "lanzaouem ar groaz [=herb of the cross], "lerepontrina", "lirobotannum", "lustago", "menthe de chat", Mercurie's moistblood", "militaris", "morméno", "nymphaea", "palumbaris", "peltoclotis", "peltodotes", "pijounière", "qanna-biyé", "recia", "riz el hhamán" [=pigeon's food], "sabiarella", "sacra frondis", "sacralis", "sacratimen", "sagmen"m "sagmina", "sanguinaria", "thiabsenti", "trixage", "varlenn", "varvan-na", "varvègne", "varvéna", "varvéné", "varvénō", "vèlvône", "vènèré", "vèrbêna", "verbana columbina", "verbena mascula", "verbena recta", "vèr bén ay", "verbene", "verbien", "verbigena", "vèrléne", "vèrlin-ne", "vermaine", "vèrmèno", "vermina", "verminaca", "verminacia", "verminatio", "verpidion", "vertipedium", "vertipodium", "vertiroedium", "verveine droicte", "vèrvâle", "vèrvâlo", "verveun", "vervine", "vèrvin-ne", "vèrvouin-ne", "virroni", "vorouéne", "vouorvénō", "vratour", "vrévin-na", "werbinadj", "ysendeck", and "yzerne". Quite a few of these names go back to classical times and to the Middle Ages. This brings to 421 the number of vernacular names thus far listed by me for this plant.

Don (1830) calls V. officinalis the "official vervain", V. sororia the "sister vervain", and V. spuria the "spurious vervain" — the first of these he admits as native to England, the second he says was introduced into English gardens from Nepal in 1824, and the third as introduced from "N. Amer." in 1731. Sweet calls the same three taxa the "common", "sister", and "jagged-leaved" vervain and gives 1823 as the date of introduction of the second.

Rolland (1910) also tells us, quoting various (mostly old) authors, that "cette herbe sacrée était cueillie à Rome, sur le Capitole par les Féciaux. Celui qui la portait était appelé 'verbenarius'." Of the name, "fleur de madame", he notes that this is in contradistinction to "fleur de monsieur", which is applied to Sisymbrium officinale. He continues: "L'érbo de la vèrméno Fo coulé lou sanc

séns douibri la véno - la verveine fait couler le sang sans qu'on ouvre la veine....La verveine passe pour guérir nombre de maladies et en biens des endroits pour garantir des sorciers celui qui la porte sur soi. On emploie cette plante comme détersive, on dit qu'elle mang le sang....Prenez chaque matin, pendant neuf jours, un morceau de pain et une gousse d'ail; puis allez les déposer devant un pied de verveine. Cela fait vous aurez soin d'uriner sur le tout; c'est un remède infallible contre les fièvres quartes....Pisser sur la verveine porte bonheur....Pour morsure de serpent, ardez la vervaine et en faites poudresi la mettez sur la morsure, si garira. Et qui portera la vervaine suz soy jamais serpent ne le grevera.....Les vieilles femmes vont chercher la verveine dont elles se serviront comme remède, au clair de la lune et en marchant à reculons....

"Le sorcier, qui veut savoir quelle maladie a celui qui vient le consulter, cueille, en décours de la lune, trois branches de verveine qu'il laisse macérer pendant trois jours et trois nuits dans du vinaigre. Au lever de la lune, il reconnaît, à la manière dont les feuilles sont entrelacées, de quelle maladie son client est atteint....Sur les vertus médicinales de la verveine, voyez encore: 'Dialogue des créatures' (lh:82)....Pour n'estre point las en allant, prens verveine cueillie la veille de la Saint-Jehan et la porte sur toy....Pour qu'un cheval ne se lasse pas en courant attachez lui la grosse dent du loup en marchant et pendez lui au cou des racines de verveine et d'armoise....Pour escalader facilement les montagnes, les armaillis et surtout les garçons de chalet mettent à leur jarretière un rameau de verveine qu'ils appellent 'vérvena à corre' - verveine à courir....Pour faire dix lieues à l'heure vous appliquez sur la rate un amplâtre composé de divers ingrédients parmi lesquels sept feuilles de verveine.....

"La verveine donne de la force aux lutteurs....Au Sabbat les diabolotins se font des jarretières de verveine pour marcher sans fatigue....Pour que les pompiers produisent beaucoup, on met un brin de verveine dans les branches....Si on fromme les poules avec de la verveine sauvage, on est assuré de les vendre un bon prix... La femme qui a perdu son lait, doit, pour le recouvrer, cueillir trois sommets de branches de verveine, en récitant le 'Pater noster' et l'Ave Marie' et les porter sur soi....."un brin de verveine porté constamment sur soi, rend chaste....Cueillie et brûlée le jour de la Saint-Jean la v. guérit les gernies. Nos paysans disent ironiquement que, dans sa cendre, se trouve le 'gekkensteen' (=pierre des fous).....

"Les femmes blanches, apparitions nocturnes, présentent aux personnes qu'elles rencontrent une branche de chêne ou d'herbe de la croix (verveine). Si l'on accepte ce talisman, on sera doué d'autant d'années de puissance et de joie que la branche a de feuilles; mais au bout de ce temps, votre âme appartiendra au démon...Quand on veut acquérir l'affection d'une personne, on lui présente de la verveine.....

"Conjuration pour se faire aimer. Il faut par trois vendredis à duit heures du matin faire autour d'une verveine trois tours à rebours et bénédiction de la main gauche; et le dernier vendredi

l'arracher de la main gauche et en la cueillant il faut dire ces mots: 'o pega verena, o pega, o pega, Lucia verena, Lucia verena, Lucia, o Luna, Luna'. Puis il faut faire poudre de cette verveine, en disant: 'Je te conjure aux noms de Vénus et de Cupidon, du Soleil et de la Lune que celle de toi je toucherai ne puisse nul autre aimer que moi et m'aime comme toi même'. Puis en touchant la fille, dites: 'Audi filia (ici le nom de la fille) et inclina aurem tuam et obliviscere populum tuum et domum patris tui et sequere me'.....

"Autre incantation pour se faire aimer: Le premier vendredi de la nouvelle lune, il faut avoir un couteau neuf et aller cueillir une verveine. Il faut se mettre à genoux, la face tournée vers le soleil levant et, coupant la date herbe avec le couteau, dire: 'Sara isquina safos; je te cueille, herbe puissante, afin que tu me serves à ce que je voudrai'. Puis vous vous léverez sans regarder derrière vous. Étant dans votre chambre vous la ferez sécher et pulvériser et vous ferez avaler cette poudre à la personne.....

"Autre incantation pour se aimer: Prenez de la verveine que vous pilerez et en frotterez le talon de votre main gauche, puis avec cette main, vous formerez un signe de croix à votre front, ensuite à celui de la fille, en disant: 'Cathos, que ton désir seconde au mien comme celui de Saint-Joseph avec Marie!'.....

"Le verveine prise le soleil étant en Aries, avec de la graine de pivoine d'un an, mises en poudre, si la poudre est mise entre deux amants, aussitôt ils auront querelle.....

"Language des fleurs. — La verveine signifie: ne me laissez pas pour une autre....Un brin de verveine sauvage, offert à une fille, équivaut à une déclaration....La verveine symbolise les enchantements....La verveine symbolise l'inspiration, la poésie."

Gibbs (1974) reports cyanogenesis absent from the leaves and seeds of this species, leucoanthocyanin absent from the leaves, and syringin absent from the stems; in addition, the Ehrlich test gave negative results in the leaves.

Keys (1976) says that in China the leaves are used medicinally. The taste is bitter. The "Plant contains an essential oil (comprising citral, geraniol, limonene, verbenone), invertin, a bitter principle, verbenalol ($C_{11}H_{14}O_5$; long prismatic needles; m.p. 133°; soluble in ether, acetic acid; poorly soluble in water) and the glycoside verbenalin ($C_{17}H_{25}O_{10}$; bitter needles; m.p. 178°; freely soluble in water; slightly soluble in alcohol, acetone; insoluble in chloroform, ether). Verbenalin in frogs produces mucosal excoriation. Prescribed as emmenagogue. Dose, 19–18 gm."

Sutherland refers to V. officinalis as "frequent" on steep slopes in Ethiopia; the corollas are described as having been "purple" on his no. 309, "bluish-violet" on Westra & Rooden 189, and "blue" on Beach 5110. Beach describes the plant as "a vigorous much-branched weed". On Sebald 381 the corollas were "lilac" in color when fresh.

The Fitter work cited in the bibliography of this species is dated "1974", but was not actually issued until February 17, 1975.

It is also worth noting here that although Bock (1522) uses the name, Verbena foemina, in his text, his accompanying illustration very plainly is meant to depict V. officinalis.

Stokes (1812) gives some interesting sidelights about this species, telling us that Linnaeus believed the species "to have been wafted by the sea to Sweden". He quotes Miller as saying that it is "Never found above a quarter of a mile from a house". He states that Curtis, Lightfoot, and Scopoli classified it "after Mentha at the end of the order Gymnospermia of the class Didynamia, considering as a genus connecting the Personatae to the Verticillatae", while Hudson placed it "between Nepeta and Mentha, apparently regarding it with Ray as really belonging to the Verticillatae, in which disposition he has been followed by Walcott, Sibthorpe, and Smith.....where it is acknowledged to be erroneously placed in the order Gymnospermia of the class Didynamia." He affirms that Ray described the corollas as pale-blue, while Bauhin called them pale-purplish. He goes on to say: "Root perennial according to Ray and Curtis, Sibth. Salisb. W. and Smith; biennial according to Huds, Hort. kew. and Donn; annual according to Boerh. Linn. and Lightf. Are we hence to conclude that it is sometimes perennial, sometimes biennial and sometimes annual, or to learn how little dependence in investigating plants is to be placed on the marks even of cultivating botanists, when we observe Curtis, Auton and Boerhaave holding opposite opinions?"

Loesener (1912) cites Seler 3460 from Atascosa County, Texas, as "V. officinalis L. forma?", but the plant represented is almost certainly V. halei. The Curtiss 677 and Rugel 121, cited below, were previously regarded by me as V. domingensis Urb., but I feel now that they are probably a form of V. officinalis (or even perhaps V. halei Small). This may prove true of most, if not all, of the Cuban material previously cited under V. domingensis, a species very likely endemic to Hispaniola.

The Herb. Zuccarini s.n. [Hort. bot. Monac.], cited below, is a mixture with xV. baileyanus Moldenke. The Meebold 12840, distributed as V. officinalis, actually is V. brasiliensis Vell., McNeal 925 is V. californica Moldenke, Eggers 2175 is V. domingensis Urb., Karwinski s.n. is V. ehrenbergiana Schau., D. Dickinson s.n. [June 8, 1918], Lindheimer 1076 & s.n. [Galveston, May 1843], Pickett & Bot. Class 60, Thomas & Grenillion 2487, and Wurzlow s.n. [Sept. 15, 1917] are V. halei Small, Mukherjee s.n. [12.9.74] is xV. hybrida Voss, M. E. Jones 2215 is V. lasiostachys Link, Clemens 42170, Meebold 7018, 8304, & 12839, and Schlieben 7691 are V. litoralis H.B.K., Pringle 8534 is V. menthaefolia Benth., Repton 1298 is V. officinalis var. natalensis Hochst., J. Z. Weber 2294 is V. supina f. erecta Moldenke, and Robertson s.n. [June 5, 1899] is V. nuda Lehm.

VERBENA OFFICINALIS var. GAUDICHAUDII Briq.

Additional bibliography: Moldenke, Phytologia 28: 364 & 443 (1974) and 34: 602. 1976.

The Burke 55, previously cited by me as this variety, actually proves better regarded as representing var. natalensis Hochst.

Additional citations: AUSTRALIA: State undetermined: F. v. Mueller s.n. (Mu—1574).

VERBENA OFFICINALIS var. MACROSTACHYA (F. Muell.) Benth.

Additional bibliography: Moldenke, Phytologia 24: 27. 1972.

Additional citations: AUSTRALIA: Queensland: F. v. Mueller s.n. [Peake Downs] (Mu—1571—isotype, Z—photo of type).

VERBENA OFFICINALIS var. NATALENSIS Hochst. ex F. Krauss, Flora 28: 68, hyponym. 1845.

Bibliography: F. Krauss, Flora 28: 68. 1845; Moldenke, Résumé Suppl. 4: 17. 1962; Moldenke, Phytologia 10: 198 & 213. 1964; Moldenke, Fifth Summ. 2: 687. 1971; Moldenke, Phytologia 28: 364 (1974) and 34: 261, 262, & 279. 1976.

Although unaccompanied by a formal description, this variety is clearly based on Krauss 151 from "ad fluv. Umlaas, Natal, Dec." The unnumbered Krauss collection in the Munich herbarium is probably a part of the type collection.

Recent collectors speak of this plant as an erect perennial herb, 3 feet tall, and have found it growing in waste ground and "locally frequent" along old roads, at altitudes of 1300-1580 m., flowering in August, October, and December, and fruiting in August. The corollas are said to have been "purple" on Repton 1298, "mauve" on E. A. Robinson 5596, and "pale mauve" on Acocks 20990.

Material of this taxon has most generally been identified and distributed in herbaria as typical V. officinalis L. and many of the southern African specimens cited by me in previous installments of these notes may prove, on re-examination, to represent this variety. The Burke 55, cited below, was incorrectly cited by me in my 1974 work as var. gaudichaudii Briq.

Citations: ZAMBIA: E. A. Robinson 5596 (Mu). RHODESIA: Fries, Norlindh, & Weimarck 4002 (Mu); Morris 355 (Mu). SOUTH AFRICA: Cape Province: Krauss s.n. [-151?] (Mu-352-isotype?). Orange Free State: Acocks 20990 (Mu). Transvaal: Burke 55 (Pd); Repton 1298 (Z).

XVERBENA OKLAHOMENSIS Moldenke

Additional bibliography: Moldenke, Phytologia 28: 365 & 457. 1974.

VERBENA ORCUTTIANA Perry

Additional bibliography: Moldenke, Phytologia 28: 365. 1974.

Moran encountered this plant at 1500-1680 meters altitude, flowering and fruiting in July and August, referring to it as "common", "common in meadows and common for miles in open pine forests", and "common with Artemisia tridentata in openings in Jeffrey pine forests. He describes the corollas as "blue" on his nos. 16439 & 16479.

Additional citations: MEXICO: Baja California: R. V. Moran 16439 (Sd-71882), 16479 (Sd-71870), 18135 (Sd-76425).

Additional citations: CHILE: Coquimbo: Werdermann 225 (Mu).

VERBENA ORIGENES var. **GLABRIFLORA** Moldenke

Additional bibliography: Moldenke, Phytologia 24: 29. 1972.

Zöllner has found this plant growing at 4000 meters altitude, flowering and fruiting in January.

Additional citations: CHILE: Antofagasta: Zöllner 8309 (Ac).

VERBENA OSTENI Moldenke

Additional bibliography: Moldenke, Phytologia 28: 365. 1974.

Recent collectors have encountered this plant "em afloramento rochoso", flowering in October and November. The corollas are described as having been "white" on both of the Brazilian collections cited below.

Additional citations: BRAZIL: Rio Grande do Sul: Lima, Vianna, Ferreira, & Irgang ICN.20982 (Ut-320453); Lindeman, Irgang, & Valls ICN.8484 (Ut-320454). URUGUAY: Herter 1000 [Herb. Herter 82763] (Mu).

VERBENA OVATA Cham.

Additional & emended bibliography: Buek, Gen. Spec. Syn. Candol. 3: 495. 1858; Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 717 (1969) and imp. 2, 717. 1974; Moldenke, Phytologia 30: 161. 1975.

The corollas are said to have been "violet" on Schinini & Carnevali 10297 and the plant was found growing "en pantanos".

Additional citations: PARAGUAY: Fiebrig 502 (Mu-4040). ARGENTINA: Corrientes: Schinini & Carnevali 10297 (Ld).

VERBENA PARODII (Covas & Schnack) Moldenke

Additional & emended bibliography: Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 715 (1969) and imp. 2, 715. 1974; Moldenke, Phytologia 30: 162 (1975) and 31: 388. 1975.

Recent collectors have found this plant in fruit in November (in addition to the months previously reported by me). The corollas on Fabris & Schwabe 5022 are said to have been "lilac" in color when fresh.

Additional citations: ARGENTINA: Buenos Aires: Fabris & Schwabe 5022 (Mu). Mendoza: G. Dawson 3252 (Mu).

VERBENA PARVULA Hayek

Additional bibliography: López-Palacios, Revist. Fac. Farm. Univ. Los Andes 14: 23 (1974) and 15: 90 & 93. 1975; Moldenke, Phytologia 30: 162 (1975) and 31: 257 & 258. 1976; Soukup, Biota 11: 19. 1976; Moldenke, Phytologia 36: 30, 33, 52, 226, & 236. 1977.

Taylor has encountered this plant "in low forest and wet up-land pastures on mountain slopes" in Costa Rica. López-Palacios (1974) cites López-Palacios 2552 from Mérida, Venezuela, deposited in the Universidad de Los Andes herbarium. In his 1975 work he comments that "En los pocos ejemplares venezolanos (López-Palacios 2552 y Ruiz-Terán & López-Figueiros 2377), fuera de su hábito reducido no le encuentro diferencia alguna con la V. litoralis, y a mi modo de ver creo que esta especie no pasa de ser una forma anana de aquella, debida a las condiciones ecológicas desfavorables de clima y altura." He then quotes Macbride (1960) and concludes "En el primer párrafo simplemente he expuesto mi opinión para si algún día llega a tenerse en cuenta por quien se enfrente con la revisión del género."

Additional citations: COSTA RICA: Heredia: J. Taylor 17625 (N).

VERBENA PARVULA var. GIGAS Moldenke

Additional bibliography: Moldenke, Phytologia 24: 31. 1972; López-Palacios, Revist. Fac. Farm. Univ. Los Andes 15: 93. 1975; Soukup, Biota 11: 19. 1976; Moldenke, Phytologia 34: 257 & 258 (1976) and 36: 33. 1977.

Recent collectors have encountered this plant at altitudes of 2100—3600 meters. In addition to the months previously reported by me, it has been found in anthesis in May and in fruit in May and June.

López-Palacios describes it as "hierba erecta de ca. 60 cm. de aspecto similar a la V. litoralis, ca. de la cual crece, pero de hojas más pequeñas y más pilosas" and "hierba más o menos postrada, espigas algo cilíndricas, fl. violado-lilas". He found it flowering and fruiting in December and January.

Additional citations: ECUADOR: Chimborazo: Herb. Univ. Cent. Quito 2345 (Mu). Loja: López-Palacios 4164 (Ld). Pichincha: Herb. Univ. Cent. Quito 2340 (Mu), 2343 (Mu), 2346 (Mu); López-Palacios 4198 (Z). BOLIVIA: La Paz: W. Forster s.n. [8.I.1954] (Mu).

VERBENA PARVULA var. OBOVATA Moldenke, Phytologia 36: 52. 1977.

Bibliography: Moldenke, Phytologia 36: 52. 1977.

Citations: ECUADOR: Pichincha: López-Palacios 4250 (Z-type).

VERBENA PERAKII (Covas & Schnack) Moldenke

Additional & emended bibliography: Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 715 & 717 (1969) and imp. 2, 715 & 717. 1974; Moldenke, Phytologia 30: 162. 1975.

VERBENA PERENNIS Wooton

Additional & emended bibliography: G. W. Thomas, Tex. Pl. Ecolog. Summ. 78. 1969; Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 717 (1969) and imp. 2, 717. 1974; Moldenke, Phytologia 30: 162 (1975) and 36: 244. 1977.

Higgins encountered this plant in gravelly to sandy or sandy

clay-loam soils in pinyon-juniper association, while the Corrells encountered it in "rocky soil in small mountains". Chiang and his associates found it growing in calcareous gravel in "isotal o matorral" on limestone hills, associated with Dasylirion, Quercus, and Rhus. Hess & Stickney refer to it as a "common perennial, 60 cm. tall", with "blue-violet" corollas, and found it on slopes of low limestone hills in pinyon-juniper-grassland with Agave, Dasylirion, Opuntia, Nolina, Rhus, Berberis, etc. The corollas are said to have been "purple" on Correll & Correll 30882. Thomas (1969) calls it "perennial verbena".

Additional citations: TEXAS: Brewster Co.: Hess & Stickney 3406 (N). Culberson Co.: Correll & Rollins 23897 (N). Pecos Co.: Correll & Correll 30882 (N). NEW MEXICO: Eddy Co.: Higgins 9228 (N). Guadalupe Co.: Higgins 8996 (N). MEXICO: Coahuila: Chiang C., Wendt, & Johnston 9178 (Ld).

XVERBENA PERENNIS var. JOHNSTONI Moldenke

Additional bibliography: Moldenke, Phytologia 28: 367. 1974.

Henrickson found this plant to be "frequent perennial on rocky limestone slopes", at 4500 feet altitude, growing in association with Acacia, Dalea, Dasylirion, Hilaria, Mimosa, and Yucca, flowering and fruiting in July. The corollas on his no. 11366 are said to have been "purple-blue" when fresh.

Additional citations: MEXICO: Coahuila: Henrickson 11366 (Ld).

XVERBENA PERPLEXA Moldenke

Additional bibliography: Moldenke, Phytologia 24: 33 (1972) and 36: 147. 1977.

Reeves encountered what appears to be this hybrid at an altitude of 3500 feet, flowering and fruiting in August, but misidentified it as V. ciliata Benth.

Additional citations: ARIZONA: Santa Cruz Co.: T. Reeves R. 1166 (W--2737258).

XVERBENA PERRIANA Moldenke

Additional synonymy: Verbena x perianna Perkins, Estes, & Thorp, Bull. Torrey Bot. Club 102: 197, in textu. 1975.

Additional bibliography: Perkins, Estes, & Thorp, Bull. Torrey Bot. Club 102: 194 & 197. 1975; Moldenke, Phytologia 30: 162 (1975), 34: 249, 250, & 279 (1976), and 36: 221. 1977.

The Iltis, Bell, Melchert, Patman, & Witt 12361, cited below, was previously incorrectly cited by me as V. hastata L. It was collected in flower and fruit in October.

Additional citations: ILLINOIS: Cass Co.: Geyer s.n. [Beardstown, July 1842] (Mu-416—cotype). WISCONSIN: Marquette Co.: Iltis, Bell, Melchert, Patman, & Witt 12361 (Wa). MISSOURI: Saint Louis: Engelmann s.n. [St. Louis] (Mu-417—cotype, Mu-1678—cotype).

VERBENA PERUVIANA (L.) Britton

Additional synonymy: Verbenella chamaedryfolia Juss. ex Spach, Hist. Nat. Veg. Phan. 9: 238. 1840. Verbena chamasedrufolia Robledo, Bot. Med. 392, sphalm. 1924. Verbena lindleyi Part., in herb.

Additional & emended bibliography: Loud., Hort. Brit., ed. 2, 552. 1832; Sweet, Hort. Brit., ed. 3, 553. 1839; Spach, Hist. Nat. Veg. Phan. 9: 238—239. 1840; Bartsch in Loud., Hort. Brit. Suppl. The corollas of this plant are described as "red" on Cristóbal & al. 1141 and on Schinini & Miranda 9576 and "very red" on Turner 9176. Gillanders and his associates (1973) recommend this plant for "sunny places and walls". Sweet (1830) says that this species was introduced into English gardens from Buenos Aires, Argentina, in 1827; he calls it the "scarlet-flowered vervain". Spach calls it the "verbénelle à feuilles de germandrée". Knoche (1921) reports it cultivated in the Balearic Islands, where it is called "carmelitana", a name also used for xV. hybrida Voss.

The Herb. Herter 82941, Herter 1057, Herzog 1217, and Pflanz 951, distributed as V. peruviana, are actually V. incisa Hook., while Hort. Parag. 11782 and T. Rojas 3395 are V. phlogiflora Cham., Block s.n. is V. rigida Spreng., and Torgo s.n. [Herb. Brad. 21257] is V. selloi Spreng.

VERBENA PERUVIANA f. ROSEA Moldenke

Additional bibliography: Anon., N. Y. Times D.41, April 6, 1975; Moldenke, Phytologia 30: 163—164. 1975.

Additional illustrations: Anon., N. Y. Times D.41, April 6, 1975.

It seems probable, from the illustration and description, that Stern's "Pink Princess" Trailing Verbena may well represent this form. In the advertisement cited in the bibliography above (1975) the plant is described as a "full-flowering Trailing Verbena", giving "a refreshing flowerfall of exquisite two-toned pink blooms all summer long" when grown in a hanging basket. It is said to bloom "continuously from spring 'til frost. Just fill flowerpots, planters, boxes or baskets with our brilliantly blooming 'Pink Princess' (T) [-Trade name] Trailing Verbena and hang in full or part sun in your windows, but preferably outdoors on porch or patio. With a little loving care and plenty of watering, you can enjoy magnificent two-toned pink sprays all summer and fall! Pinch back stems for continual heavy blooming and lovely symmetrically shaped plants. Keep indoors over the winter and next spring enjoy another fantastic flowerfall"...."If you plant our Trailing Verbena 6" to 12" apart soon delicate pink blooms cover the ground in closely clustered waves of color to cover bare spots [as a groundcover]....create beautiful borders.. form a spectacular sea of pink under gladioli, lilies and other tall plants. And they keep producing flowers right up to the heavy frost! Not hardy — so treat as Geraniums or Petunias".

VERBENA PHLOGIFLORA Cham.

Additional synonymy: Verbenella tweediana Hook. ex Spach, Hist. Nat. Veg. Phan. 9: 239. 1840. Verbena phlogiflora α vulgaris Schau. in A. DC., Prodr. 11: 537. 1847. Verbena phlogiflora α vulgaris [Cham.] ex Buek, Gen. Spec. Syn. Candoll. 3: 495. 1858. Verbena decemloba Mart. ex Moldenke, Phytologia 34: 278, in syn. 1976.

Additional & emended bibliography: G. Don in Loud, Hort. Brit. Suppl. 1: 680. 1832; Baxt. in Loud., Hort. Brit. Suppl. 2: 680. 1839; Sweet, Hort. Brit., ed. 3, 553. 1839; Spach, Hist. Nat. Veg. Phan. 9: 239. 1840; Baxt. in Loud., Hort. Brit. Suppl. [3]: 655.

1850; Buek, Gen. Spec. Syn. Candoll. 3: 494—496. 1858; Vilm., Fl. Pleine Terr., ed. 1, 939 (1865), ed. 2, 2: 976 (1866), ed. 3, 1: 1200 (1870), and ed. 4, 1067. 1894; Sonohara, Tawada, & Amano, Fl. Okin. 132. 1952; Bolkh., Grif., Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 715 & 717 (1969) and imp. 2, 715 & 717. 1974; León & Alain, Fl. Cuba, imp. 2, 2: 282. 1974; Moldenke, Phytologia 30: 139, 140, 150, & 164 (1975), 31: 411 (1975), 34: 278 & 279 (1976), and 36: 47, 229, & 240. 1977.

Hatschbach has encountered this plant repente on dry rocky campos and in abandoned cultivated ground, while Schinini & Carnevali found it "en bajo pantanoso entre matas de gramineas y ciperaceas". Others have encountered it "in wet drainage zone of campo at margin of capão or wood island" and in a "small campo on flat hilltop, an herb to 1 m. tall, living in forest margin". Bornmüller reports it from 400 m. altitude in Brazil; Quarín found it "en pantano" in Argentina.

The corollas on Hatschbach 35201 and on Schinini & Carnevali 10300 are said to have been "purple", those on Hatschbach 35172 & 35640 were "violet", those on Pabst 6093 and E. Pereira 6266 were "light-violet", and those on Quarín 2863 were "lilac-violet". Lindeman & Haas describe the corollas on their no. 3998 as "purple (1/2P3/8)" and on their no. 1120 as "purple 10P7/6, above 10P5/10, center 10PB6-7/6".

Spach (1840) calls the species "verbénelle de Tweedie", while Sonohara and his associates (1952) call it "bijozakura". Sweet (1839) tells us that it was introduced into English gardens from South America before 1839.

Material of V. phlogiflora has been misidentified and distributed in some herbaria as V. chamaedryfolia Juss. On the other hand, the Rodrigues 530 [Herb. Inst. Miguel Lillo 31561], previously reported by me and distributed as V. phlogiflora, actually is V. spectabilis Moldenke, while Bornmüller 143 is V. incisa Hook.

VERBENA PINETORUM Moldenke

Additional bibliography: Moldenke, Phytologia 28: 372 (1974) and 36: 244. 1977.

The Walker collection cited below matches the type of the species very well, although the bracts are relatively longer than they are in some other collections referred here.

Additional citations: MEXICO: Chihuhua: S. Walker 76G37 (N).

VERBENA PINNATILOBA (Kuntze) Moldenke

Additional bibliography: Moldenke, Phytologia 24: 40-41. 1972.

The corollas are said to have been "blue" on Ibarrola 542.

Additional citations: ARGENTINA: Corrientes: Ibarrola 542 (U-3305818).

VERBENA PLATENSIS Spreng.

Additional bibliography: Loud., Hort. Brit., ed. 2, 552. 1832; G. Don in Loud., Hort. Brit. Suppl. 2: 704. 1839; Sweet, Hort. Brit., ed. 3, 553. 1839; Bart. in Loud., Hort. Brit. Suppl. [3]: 655. 1850; Buek, Gen. Spec. Candolle. 3: 495 & 496. 1858; Vilm., Fl. Pleine Terr., ed. 1, 938-939 (1865), ed. 2, 2: 976 (1866), ed. 3, 1: 1199-1200 (1870), and ed. 4, 1066-1067 & 1070. 1894; Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 715 & 717 (1969) and imp. 2, 715 & 717. 1974; El-Gazzar, Egypt. Journ. Bot. 17: 75 & 78. 1974; Molina R., Ceiba 19: 96. 1975; Moldenke, Phytologia 30: 150 & 164-165 (1975), 31: 392 & 412 (1975), and 34: 270. 1976.

Additional illustrations: Voss in Vilm., Fl. Pleine Terr., ed. 4, 1066. 1894.

Molina R. (1975) records this species as cultivated in Honduras, but I suspect that he may actually be referring to white-flowered forms of V. hybrida Voss which would be far more likely to be found there.

Sweet (1839), calling V. platensis the "germander-like ver-vain", asserts that it was introduced into English gardens from Buenos Aires, Argentina, in 1837. The corollas on the Cabrera & al. collections and on Lossen 117, cited below, are said to have been "white" when fresh.

Additional citations: URUGUAY: Herter 750a [Herb. Herter 85298] (Mu). ARGENTINA: Buenos Aires: Cabrera & Fabris 16531 (Mu). Córdoba: Lossen 117 (Mu-4376). [hort. Monac. 1846] (Mu-395); Prince Paul of Wurtemberg s.n. [Hort. Mergentheim 1840] (Mu-1583).

VERBENA PLATENSIS f. IVERIANA (Bosse) Moldenke

Additional bibliography: Moldenke, Phytologia 30: 164-165 (1975) and 31: 392 & 412. 1975.

VERBENA PLICATA Greene

Additional & emended bibliography: G. W. Thomas, Tex. Pl. Ecolog. Summ. 78. 1969; Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 717 (1969) and imp. 2, 717. 1974; E. H. Jordan, Checklist Organ Pipe Cactus Natl. Mon. 7. 1975; Moldenke, Phytologia 30: 156 & 165 (1975) and 36: 244. 1977.

The Spellenbergs found this plant growing "in large open grassy areas with mesquite and Ephedra in a low swale, densely grassy and

weedy, with much tobosa and desert-willow". Other recent collectors have encountered it in calcareous gravel in "matorral desértico inerme on limestone hills and north-facing fans", growing in association with Agave lecheguilla, Cordia parvifolia, Larrea tridentata, and Grusonia. Higgins encountered it "on gravelly exposed limestone outcrops in Acacia-Prosopis-Sophora association" and "in sandy to gravelly limestone soils in Larrea-Acacia-Proso-pis association".

The corollas on Chiang, Wendt, & Johnston 9137 are said to have been "lavender" in color when fresh, while those on Spellenberg & Spellenberg 3823 were "pale blue-lavender". Mrs. Jordan (1975) calls this the "ribbed vervain".

The Reeves R.1198, distributed as V. plicata, actually is V. neomexicana (A. Gray) Small, while R. V. Moran 16893, 20727, 20748, & 21749 are V. neomexicana var. hirtella Perry.

Additional citations: OKLAHOMA: Jackson Co.: Waterfall 11980 (Mi). TEXAS: Presidio Co.: Higgins, Higgins, & Higgins 9867 (N), Val Verde Co.: Higgins, Higgins, & Higgins 9964 (N). NEW MEXICO: Hidalgo Co.: Spellenberg & Spellenberg 2823 (Ld, N). MEXICO: Coahuila: Chiang, Wendt, & Johnston 9137 (Ld).

VERBENA PLICATA var. DEGENERI Moldenke

Additional bibliography: G. W. Thomas, Tex. Pl. Ecolog. Summ. 78. 1969; Moldenke, Phytologia 24: 46. 1972.

Thomas (1969) calls this the "Degener verbena". It seems most likely to me now that this taxon is not worthy of more than form rank.

VERBENA POGOSTOMA Klotzsch

Additional bibliography: Buek, Gen. Spec. Syn. Candoll. 3: 495. 1858; Moldenke, Phytologia 24: 46. 1972; Soukup, Biota 11: 19. 1976.

VERBENA PORRIGENS R. A. Phil.

Additional bibliography: Moldenke, Phytologia 30: 165. 1975.

The Werdemann 789, distributed as V. porrigena, actually is V. atacamensis Reiche.

VERBENA PULCHELLA Sweet

Emended synonymy: Glandularia pulchella Sweet ex Spach, Hist. Nat. Veg. Phan. 9: 240. 1840; Troncoso & Cabrera, Fl. Prov. Buenos Aires 137. 1965.

Additional & emended bibliography: Sweet, Hort. Brit., ed. 2, 419. 1830; G. Don in Loud., Hort. Brit. Suppl. 1: 680. 1832; Loud., Hort. Brit., ed. 2, 552. 1832; Baxt. in Loud., Hort. Brit. Suppl. 2: 680. 1839; Sweet, Hort. Brit., ed. 3, 553. 1839; Spach, Hist. Nat. Veg. Phan. 9: 240—241. 1840; Schau. in A. DC., Prodr. 11: 552. 1847; Baxt. in Loud., Hort. Brit. Suppl. [3]: 655. 1850; Buek,

Gen. Spec. Syn. Candoll. 3: 495. 1858; Vilm., Fl. Pleine Terr., ed. 1, 937-938 (1865), ed. 2, 2: 975 (1866), ed. 3, 1: 1198 (1870), and ed. 4, 1066. 1894; Moldenke, Phytologia 30: 166 & 172 (1975), 34: 279 (1976), and 36: 139, 153, 231, & 240. 1977.

Additional illustrations: Voss in Vilm., Fl. Pleine Terr., ed. 4, 1066. 1894.

Vilmorin (1863) calls this species "verveine délicate", while Spach (1840) calls it "glandularia élégant". Sweet (1830) calls it the "pretty vervain" and avers that it was introduced into English gardens from Buenos Aires, Argentina, in 1827.

The Hiedlmayr s.n. [Hort. Lipsiensis], Herb. Zuccarini s.n. [h. Monac. 1836], and Herb. Kummer s.n. [h. Paris.], distributed as V. pulchella, actually are V. temnisepta Briq.

Additional citations: URUGUAY: Herter 1805 [Herb. Herter 96556] (Mu.).

VERBENA PULCHELLA f. COROLLA-ALBIDA Paxt.

Additional bibliography: G. Don in Loud., Hort. Brit. Suppl. 1: 680. 1832; Bart. in Loud., Hort. Brit. Suppl. 2: 680. 1839; Sweet, Hort. Brit., ed. 3, 556. 1839; Moldenke, Phytologia 28: 375. 1974.

VERBENA PUMILA Rydb.

Additional synonymy: Verbena pumila "Rydb. in Small" ex G. W. Thomas, Tex. Pl. Ecolog. Summ. 78. 1969.

Additional & emended bibliography: G. W. Thomas, Tex. Pl. Ecolog. Summ. 78. 1969; Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 717 (1969) and imp. 2, 717. 1974; Hinton & Rzedowski, Anal. Esc. Nac. Cienc. Biol. 21: 111. 1975; Moldenke, Phytologia 30: 166 (1975), 31: 392 (1975), 34: 279 (1976), and 36: 141 & 147. 1977.

The D. Wright 23, distributed as V. pumila, actually is V. bipinnatifida Nutt.

Additional citations: OKLAHOMA: Comanche Co.: Waterfall 11938 (Mu.). TEXAS: Comal Co.: Lindheimer 1075 (Mu-4087). Young Co.: Correll & Johnston 22126 (N). County undetermined: Lindheimer IV.501 (Mu-268).

VERBENA PUMILA f. ALBIDA Moldenke

Additional bibliography: Moldenke, Phytologia 30: 166 (1975) and 31: 392. 1975.

VERBENA QUADRANGULATA Heller

Additional & emended bibliography: G. W. Thomas, Tex. Pl. Ecolog. Summ. 78. 1969; Bolkh., Grif, Matvej., & Zakhar., Chrom. Numb. Flow. Pl., imp. 1, 717 (1969) and imp. 2, 717. 1974; Moldenke, Phytologia 30: 166 (1975), 34: 252 (1976), and 36: 147. 1977.

Thomas (1969) calls this the "four-angle verbena". Recent collectors have encountered it in calcareous gravelly loam "in izotal in canyon through limestone plateau", in calcareous rocky loam "in

crasiroslifolio espinosos on limestone hills", in sandy alluvium in "matorral desértico inerme on sandy fans", and in gypsiferous clay-loam on limestone ridges in association with Agave lecheguilla, A. falcata, A. asperrima, Feuquieria splendens, Yucca filifera, Acaea rigidula, Opuntia leptocaulis, O. rufida, Hechtia, Larrea, Dasylirion, Nolina, Quercus, and Prosopis.

Additional illustrations: Voss in Vilm., Fl. Pleine Terr., ed. 3, l: 1198 (1870) and ed. 4, 1065. 1894; León & Alain, Fl. Cuba, imp. 2, 281, fig. 121 B. 1974; Duncan & Foote, Wildfls. SE. U. S. [151] (in color). 1975.

Pittier (1926) records the popular name, "virginia", for this species in Venezuela, while Thomas (1969) calls it "veiny verbena" and Walker (1976) records "bijo-zakura" [bijo, a beautiful woman, zakhura, flowering cherry]. The corollas on Correll & Rollins 21061 are said to have been "deep reddish-purple".

López-Palacios (1975) comments that this species "Es originaria del sur del Continente, pero ha sido difundida ampliamente en cultivos de jardines botánicos y particulares, aunque en Venezuela aún no es muy abundante. Desde el punto de vista taxonómico, es inconfundido con las restantes especies venezolanas y fácilmente distingüible por sus hojas de ancha base semiabrazadoras o subcordadas."

Balakrishnan refers to this plant as a "0.5 m. tall shrub with mauve flowers", but this is certainly either an error in observation [since the plant is not a shrub] or a case of mixed labels. If the label accompanying the collection is correct in other details, he encountered the species in open places along railroad tracks [a very typical habitat], at 2400 meters altitude, flowering in December. Griffiths refers to it as a "fleshy rhizomatous perennial, 6--15 inches tall, single- to multi-stemmed; stems green, basally and apically flushed purplish-red, square, wall-foliaged; leaves semi-erect, decussate, dark-green; inflorescence dense, near-capitata, compound, those on major peduncles more or less well separated; flowers deep bluish-purple, richly colorful".

Other recent collectors describe the stems as scabrous, 4 mm. in diameter, and the corolla slightly longer than the calyx. They have encountered it in well-drained soil in association with Baptisia and in sandy clay in oak-pine flatwoods. Spindler refers to it as "infrequent in pastures or sandy soil". Godfrey speaks of the plant as "locally abundant" in old fields. Mrs. Clemens found it on the "margin of grasslands" in Queensland, while Codd refers to it as "occasional patches on roadsides" in the Transvaal. Ghazal found it to be "widespread" in Louisiana. My wife and I found it locally and sporadically very abundant on grassy road shoulders and along fencerows in North and South Carolina, Georgia, and Florida, although not as widespread as V. temnisepta in those states. Thomas reports it naturalized in a Louisiana cemetery.

Sweet (1839) calls this species the "strong-veined" and "wrinkled" vervain, introduced into English gardens from Buenos Aires, Argentina, in 1837.

The corollas on Ardoin 21, Hatschbach HH.10300, Herb. Brad. 30320, Kummrow 775, and E. Pereira 7683 are described as having been "violet" in color when fresh, while those on Codd 10208 were "dark-purple", those on C. M. Allen 658, Curry, Martin, & Allen 273, Darus 124, and Lemon 1100 were "purple", those on Augustin

37 and Horst JWH.B.281 were "deep-purple", on Vann 22 "bright-purple", on Bougere 2113 "lavender-purple", on Gonella 24 "purple to violet", on Webster & Wilbur 3352 "lavender", and those on E. Pereira 5187 "rom-claro".

Gibbs (1974) reports leucoanthocyanin absent from the leaves of this species, cyanogenesis absent from the stems and leaves, syringin absent from the stems, and the Ehrlich test giving negative results in the leaves.

The Herb. Kummer s.n. [Hort. bot. Monac.] collection, cited below, is a mixture with V. hispida Ruiz & Pav., while Hatschbach HH.10300, Herb. Brad. 30320, and E. Pereira 7682 are mixtures with V. rigida var. obovata (Hayek) Moldenke rather than var. glandulifera Moldenke as distributed by the collectors.

VERBENA RIGIDA var. GLANDULIFERA Moldenke

Additional synonymy: Verbena rigida var. glandulos Moldenke, Phytologia 34: 279, in syn. 1976. Verbena rigida var. glandulosa Moldenke, Phytologia 34: 279. 1976.

Additional bibliography: Moldenke, Phytologia 24: 132 (1972), 34: 279 (1976), and 36: 47. 1977.

Hatschbach refers to this plant as ruderal and found it in flower and fruit in December. The corollas on his no. 37899 are said to have been "lilac" in color when fresh.

The Hatschbach HH.10368, Herb. Brad. 30089 & 30956, Pabst 7898, and E. Pereira 7752 & 8623, distributed as V. rigida var. glandulifera, actually are var. obovata (Hayek) Moldenke, while Hatschbach HH.10300, Herb. Brad. 30320, and E. Pereira 7683 are mixtures of V. rigida Spreng. and V. rigida var. obovata.

Additional citations: BRAZIL: Paraná: Hatschbach 37899 (Ld).

VERBENA RIGIDA var. LILACINA (Benary & Bodger) Moldenke

Additional synonymy: Verbena lilacina Harrison, Handb. Bulbs & Peren. S. Hemisph., ed. 3, 266. 1971.

Additional bibliography: R. E. Harrison, Handb. Bulbs & Peren. S. Hemisph., ed. 3, 266. 1971; Moldenke, Phytologia 28: 381 (1974), 31: 387 & 392 (1975), and 34: 279. 1976.

Ferreira encountered this plant growing at the edge of railroad tracks, flowering and fruiting in October, describing the corolla color as "lilac". It is very probable that some of the collections cited under typical V. rigida, whose flowers are described by their collectors as "lila" may belong here, but until it is definitely ascertained what collectors mean by "lila" it is, perhaps, best to leave them under the typical form.

Additional citations: BRAZIL: Paraná: L. F. Ferreira 117 (Ld).

VERBENA RIGIDA var. OBOVATA (Hayek) Moldenke

Additional bibliography: Moldenke, Phytologia 24: 220. 1972.

Porto & Oliveira describe this plant as an herb to 50 cm. tall and the corolla color as "roxas 5P₄/11", while Lindeman and his associates refer to the corolla color as "roxas 4P₅/8" and found the plant growing in "terrena baldio". The corollas on Herb. Brad. 30956, Pabst 7898, and E. Pereira 8623 were "roxas", while those on Bornmüller 204 are said to have been "hellrosa" [-light pink] when fresh.

Hatschbach HH.10300, Herb. Brad. 30320, and E. Pereira 7683, cited below, are mixtures of this variety and typical V. rigida Spreng.

Material of this variety has been misidentified and distributed in some herbaria as V. rigida var. glandulifera Moldenke.

Additional citations: BRAZIL: Paraná: E. Pereira 7683, in part [Hatschbach HH.10300; Herb. Brad. 30320] (Mu), 7752 [Hatschbach HH.10368; Herb. Brad. 30089] (Mu). VERBENA RINCONENSIS Moldenke

Additional bibliography: Moldenke, Phytologia 24: 133 (1972) and 34: 252. 1976.

Henrickson reports this plant "infrequent in open desert" and "infrequent annual among Larrea on rocky limestone hillside with Chihuahuan Desert vegetation", associated with Berberis, Bouvardia, Dasylirion, Dyssodia, Fouquieria, Opuntia, Patrophe, Yucca, grasses, etc., at 2200–2365 m. altitude, flowering and fruiting in August and September.

Additional citations: MEXICO: Zacatecas: Henrickson 6295 (Ld), 6698 (Ld).

VERBENA RIPARIA Raf.

Additional bibliography: Moldenke, Phytologia 28: 381, 399, & 464 (1974) and 30: 159. 1975.

The Monte 2294, distributed as V. riparia, actually is V. mittha Lehmann.

Additional citations: VIRGINIA: Smyth Co.: J. K. Small s.n. [July 1, 1892] (Lv).

VERBENA ROBUSTA Greene

Additional synonymy: Verbena prostrata var. glandulosa Dunkle, in herb.

Additional bibliography: R. D. Gibbs, Chemotax. Flow. Pl. 3: 1752 & 1755 (1974) and 4: 2295. 1974; Moldenke, Phytologia 30: 168 (1975) and 36: 221 & 232. 1977.

Moran reports this plant "occasional by streams" in Baja California, while Thorne found it growing in association with Baccharis glutinosa, Ambrosia psilostachya, etc., along streams on Santa Catalina island.

Dunkle's V. prostrata var. glandulosa seems to be based on his no. 8548 from a dry stream bed on Santa Cruz island in the Channel Islands of California, where he collected it in flower and fruit in August.

Gibbs (1974) reports leucoanthocyanin absent from the leaves of V. robusta, saponin also absent, but tannin probably present.

The Blakley 5394, distributed as V. robusta, is actually V. bracteata Lag. & Rodr.

Additional illustrations: León & Alain, Fl. Cuba, imp. 2, 2: 281, fig. 121A. 1974; D. S. & H. B. Correll, Aquat. & Wetland Pl. SW. U. S., imp. 2, [1398], fig. 654 a--f. 1975.

Curiously, Don (1830) places this species in his section Trifidae (with leaves trifid) even though its leaves certainly are not normally trifid. He calls it the "scabrous vervain" and says that it was introduced into English gardens from Mexico in 1825. Sweet (1830) calls it the "rough vervain" and gives its introduction date as 1822. Thomas (1969) calls it "harsh verbena" and reports that it is also known locally as "white vervain". Churchill found it growing in sloughs in Florida; Adams found it at the edges of pastures. Brumbach encountered it in disturbed ground and reports the corolla color as "lavender-purple". Other recent collectors describe the plant as having fibrous roots, stems 1--2.5 m. tall, and "corollas as long as the calyx", and have found it growing in sandy soil, marshy land, and on spoil-banks of bayous in cypress-tupelo swamps. Lakela and her associates (1976) assert that in the Tampa Bay area [Florida] it inhabits "woods, margins, glades, [and] waste places", flowering in spring and fall.

The corollas are said to have been "purple" on Curry, Martin, & Allen 449, "lavender" on C. A. Brown 3892, "pale mauve-pink with darker eye" on C. D. Adams 11108, "whitish" on C. A. Brown 4084a, and "white" on Stam 60.

Material of V. scabra has been misidentified and distributed in some herbaria as "V. polystachia H.B.K." On the other hand, the Arceneaux 383, distributed as V. scabra, actually is V. urticifolia L., while J. A. Churchill s.n. [22 August 1970] is V. urticifolia var. leiocarpa Perry & Fernald and Herb. Zuccarini s.n. [Hort. bot. Monac.] is a mixture of V. officinalis L. and V. baileyana Moldenke.

Additional illustrations: Duncan & Foote, Wildfls. SE. U. S. [151] (in color). 1975; F. H. Montgomery, Seeds & Fruits 202, fig. 1. 1977.

Don (1830) calls this the "narrow-leaved vervain" and says that it was introduced into English gardens from "N. Amer." in 1802. Montgomery (1977) describes the seeds as "Nutlets as in V. bracteata, 2.5 x 0.8 x 0.6 mm." Browne (1974) records this species from Stone County, Arkansas. Churchill found it growing on road embankments; Harold encountered it in grassy woodlands. Demaree records it as "common on clay banks" at 275 feet altitude in Arkansas. Cooperrider (1962) found it to be frequent in low sandy ground along rivers in Clinton and Jones Counties, Iowa, while Davidson (1959) refers to it as infrequent in dry sandy soil in Louisa and Muscatine Counties in the same state. Barker (1969) records it from Butler, Chase, Cowley, Lyon, and

Wabaunsee Counties in Kansas, where, he says, it is "Occasional in rocky upland prairie, on rocky prairie slopes, [and] along roadsides and right-of-ways".

Muehlenbach considered his no. 1525 to represent a natural hybrid of this species with V. bracteata Lag. & Rodr., but I see no evidence of this supposed hybridity. I regard his collection as merely representing the edaphically erect form of V. bracteata.

The corollas on F. R. Fosberg 35716 are said to have been "blue-lavender" when fresh.

Material of V. simplex has been misidentified and distributed in some herbaria as V. carolina L. The Curtiss 1955 collection is a mixture with var. eggerti Moldenke. The Gattinger s.n. [Nashville, June-August] and Tans 1360, distributed as typical V. simplex, are better regarded as var. eggerti, while V. Keller s.n. [Aug. 24, 1917] is V. halei Small and J. A. Churchill s.n. [25 May 1954] is V. stricta Vent.

Don (1830) calls this species the "strict vervain" and says that it was introduced into English gardens from North America in 1802. Sweet (1826) calls it the "upright vervain". Thomas (1969) lists the name "mullenleaf verbain" (sic).

Churchill has found this species growing in dry open fields, on dry sandy knolls, and in gravelly disturbed soil around gravel pits in Michigan. Stephens & Brooks refer to it as "abundant with f. albiflora in dry, sandy, rocky, clay soil on prairie pasture hillsides. Montgomery (1977) describes the seeds as "Nutlets 2.8 x 0.7 x 0.6 mm., form as in V. bracteata, most of the dorsal surface coarsely reticulate, inner surfaces with a white pubescence or papillose".

Scully (1970) lists some Amerind uses for this plant, for which see under V. hastata L. in the present series of notes.

Perkins and his associates (1975) have studied "an association of V. stricta, V. bracteata Lag. & Rodr., V. halei Small, V. urticifolia L., and derived interspecific hybrids in southern Oklahoma. All hybrids but one involved V. stricta parentage. Of the four species, V. stricta produces the largest and most aggregated blossoms, the most accessible pollen, and the greatest quantity of nectar. The species is visited by the broadest spectrum of insects, including the following: Coleoptera: Anomala sp., Diptera: Atomosia melanopogon, Bacca sp. (with Verbena pollen on head), Exoprosopa sp. (with pollen on head), Neorhynchocephalus sp. (with pollen on head), Systropus sp. (with pollen on head), Homoptera: Cuerna sp., Hymenoptera: Apis mellifera (with pollen on head), Stictiella formosa, Bombus americanorum (with pollen on head), Ceratina shinnensi (with pollen on head), Dialictus sp. (with pollen on head), Megachile spp. (with pollen on head), Svastra atripes, Triepeolus sp., Xylocopa virginica, and Lepidoptera: Agraulis vanillae, Atalopedes campestris, Danaus plexippus, Euphyes vestris, Eurema lisa, E. mexicana, Grais stigmaticus, Hemisargus isola, Hylephila phyleus, Leptotes marina, Pieris protodice, Pholisora cattulus, Strymon melinus, Thorabes bathyllus, T. phylades, Vanessa virginiensis. Nine of these insects were also found visiting each of the other 3 species. Insect exclusion and artificial pollination experiments indicated that V. stricta is an outcrossing species with low seed-set through self-fertilization; V. halei and V. urticifolia are highly autogamous and V. bracteata less so. The likelihood that V. stricta will enter into interspecific hybridization is greater than that for the other 3 species. Number, frequency, and pollen-carrying ability of the interspecific pollen vectors favor crosses with V. stricta involving V. urticifolia and V. halsii."

These authors note that V. stricta "occupies disturbed sites throughout the Central United States. In southern Oklahoma, it occurs within the ranges of V. bracteata.....V. halei..... and V.

urticifolia....and hybrids frequently occur where the species are sympatric....All four species and a series of putative hybrids were found growing, almost to the exclusion of other species, on a highly disturbed area, a hog lot....Approximately 500--700 plants of V. halei and V. bracteata were present in the study area. Verbena stricta and V. urticifolia were represented by only 50--60 individuals. Pure stands of V. stricta, V. urticifolia, and V. bracteata occurred within the larger area, but in many sections at least three of the species, and at times all four, were located within a 5 m. radius. All but one of the hybrids exhibited morphological affinities with V. stricta."

They found that 5 male fertile insect-visited plants of V. stricta with 623 potential seeds had an 87.6 percent seed-set, 5 male sterile insect-visited plants with 747 potential seeds had 76.3 percent seed-set. Nine bagged plants yielded 1263 seeds and a 7.5 percent seed-set; 3 geitonogamous artificially cross-pollinated plants yielded 695 seeds and a 14.3 percent seed-set, and 2 xenogamous artificially cross-pollinated plants yielded 433 seeds and a 78.5 percentage seed-set.

"All four species have two sterile stylar lobes, one or occasionally both of which extend as elongate lobes beyond the glandular stigmatic surface. Stigmatic receptivity appears to develop first near these lobes and then to spread across the stigmatic zone. Quantities of pollen were found in the axils of the lobes, which may function as passive scrapers of pollen off the mouth-parts of probing insects. In Verbena stricta dehiscence commences the day before unfolding of the corolla lobes and continues until the corolla falls away, a total of three days. Thus, self-pollination could occur prior to exposure of the stigma; however, autodeposition of pollen is unlikely: The anthers are borne ca 2 mm above the stigma, and the pollen remains at this level. The corolla tube is inclined so that the distal third of the tube which contains the anthers is nearly horizontal. Hairs in the corolla also restrict the free fall of pollen to the stigma. Additionally, the stigma is not receptive until the flower has opened. Pollen was not observed on the stigma of bagged flowers. Spatial separation of the anthers and stigma in the other three species is less than in Verbena stricta."

They report the corolla color in V. stricta to be light-purple and the corolla 9 mm. in diameter -- the other species have less showy and smaller flowers with the corolla-tube straight (in V. stricta it is strongly curved below the anther level).

"Of the four species, Verbena stricta is probably the most attractive to insects. It is perhaps the tallest plant of the group (mostly over 100 cm) and has 4-21 upright flowering branches bearing dense aggregates of flowers....The nectar....contains 38 ± 2 percent dissolved solids. Assuming these solids to be sugars, this percentage is approximately at the mid-range of a series of sugar concentrations of nectar for 43 species of flowering plants reported by Percival (1961). Although nectar exists in the

other three species, the amount was too slight for extraction.

"Several characteristics....of the inflorescences and flowers of Verbena stricta indicate its probable attractiveness for a variety of anthophilous insects: (1) several dense, elongate spikes, each with a mass of light purple flowers forming a showy unit; (2) tubular corolla with a horizontal throat; (3) protected nectar source with a relatively high percentage of dissolved solids and the nectar sources massed.....; (4) a landing platform; and (5) a supply of easily accessible pollen at the throat of each corolla tube.....Verbena stricta was visited by the greatest diversity and number of potential pollinators.....

"All insect visitors appeared to probe the flowers of Verbena stricta for nectar with the exception of a small solitary bee (not captured), which gathered pollen only. The butterflies methodically probed several flowers on each dense branch and then flew to another branch on the same plant or an adjacent plant. Longer flights were infrequent. Foraging patterns of flies resembled those of butterflies, but the flies spent less time probing each flower and moved more rapidly from plant to plant. Bees tended to visit fewer flowers on each plant and to forage over greater distances, especially those which were gathering pollen.

"Most individual visitors were typically species specific. The only insect observed visiting indiscriminately both parental plants and their hybrid (V. stricta, V. urticifolia, and V. x deamii) was Systropus. A single Hemiarthus isola was observed to visit V. bracteata and V. stricta successively....visitors to Verbena stricta and V. halei were fairly equally divided among the three major orders of specialized insect pollinators, Diptera, Hymenoptera, and Lepidoptera....it is obvious that pollen from the other three species is viable on the stigmas of Verbena stricta, but that interspecific crosses may produce fewer seeds than intraspecific, allogamous crosses.....Nevertheless, cross-pollination among these species involving V. stricta as the carpellate parent is likely and cross-fertilization feasible."

They point out that V. stricta sets significantly fewer seeds when bagged than when open-pollinated. "Although V. stricta and V. bracteata are capable of autogamous reproduction, each shows a tendency for cross-fertilization. This tendency is most pronounced in V. stricta. Artificial pollen transfer within a single plant of V. stricta also demonstrates considerably lower seed set. This species, then, is partially self-incompatible.

"Pollen fertility in Verbena stricta varies considerably with complete sterility evidence in 3 plants, about 14 percent fertility in 4 plants, under 50 percent in 8 other plants, and the remaining 17 plants sampled exhibiting 63—98.3 percent fertility. The 15 plants of V. stricta which exhibited less than 50 percent fertility also had indehiscent anthers. Yet even in the 3 completely sterile individuals seed set was 76 percent. A bagged, pollen sterile plant set no seed while bagged, but set full seed

when exposed to pollinators. Seed set in pollen-sterile individuals approaches normalcy, and therefore such plants are ovule-fertile...pollen-sterile plants set seed only when pollen-fertile forms grow in close proximity and pollinators are readily available. Although the majority of the plants of V. stricta are capable of either outcrossing or selfing, a limited number in this locality function only as pistillate parents.

"On the basis of its reproductive biology and pollination system, Verbena stricta seems more likely to enter into interspecific hybridization than the other three species...for the following reasons: (1) V. stricta is primarily allogamous, whereas in V. halei and V. urticifolia, approximately 50 percent of the gametes are committed to autogamy; (2) V. stricta shares taxa of pollinators with each of the other three species; (3) pollen washings also indicate that interspecific crosses should occur most frequently among the triad V. stricta, V. halei and V. urticifolia. Visitors shared among V. stricta, V. halei and V. urticifolia were primarily bees and flies. The most common visitors shared by V. stricta and V. urticifolia were butterflies, which may be less dependable pollinators.

"Only one hybrid plant of V. stricta x V. bracteata parentage was found. The two outcrossing species are the least likely to hybridize. The hybrids most frequently found involved Verbena stricta as one of the parental species. Interspecific cross-pollinations, therefore, appear to be skewed in favor of V. stricta, the most attractive to the greatest number and variety of insects. In conditions where the four species are sympatric, hybrids would be expected to include V. stricta as one of the parental types, with crosses involving V. halei and V. urticifolia the most likely to occur and V. bracteata the least likely to do so."

These workers have done a tremendously important piece of research and deserve the highest praise! Many more such studies are urgently needed in this genus (and in other genera of this family) to help us to understand the taxonomic and systematic position of the many groups of puzzlingly variable or puzzlingly similar taxa.

Hall & Thompson (1959) record V. stricta from Oakland County, Michigan, where they say it is occasional in fields, especially in sandy soil; Thompson (1967) lists it for Leelanau County. In Iowa Davidson (1959) records it as a common "Weed of roadsides, railways, pastures, and other open, often sandy, places", while Cooperrider (1962) also refers to it as common in sandy roadsides and other open sandy places in that state. In Kansas Barrell notes that it is "Common, in upland prairies, on prairie slopes, along roadsides and railroad right-of-ways. Occurs throughout the area." Barber also found it "occasional in grassy lightly grazed uplands with Chrysopsis villosa" in Kansas.

Grimé (1976) says "Vervain [is] a cure for rheumatism. The following notes from Cameron Mann, a well known botanist of Kansas

City, are worth recording: 'The following remedy for rheumatism was recently communicated to me by a respectable lady, who had found it quite successful in her own case, and also with several of her friends. It was given her by an old negress who claimed many years ago to have been told of it by an Indian. The medicine is made by boiling the root and part of the stalk of one of the blue vervains in vinegar for twelve hours, and then rubbing the decoction upon the afflicted parts. Which of the species was used I could not tell from the species [specimens] shown me, as they consisted merely of root and stalk, with, fortunately one stalk bearing withered flowers. The latter identified the plant as a Verbena, but there being no leaves, I could not tell whether it was Verbena angustifolia, Verbena hastata, Verbena stricta, [or] Verbena bracteosa, all four being native here."

The Herb. Zuccarini s.n. [Hort. bot. Monac.] collection, cited below, is a mixture with V. moehringiae Moldenke.

Material of V. stricta has been misidentified and distributed in some herbaria as V. bracteosa Michx. and as V. simplex Lehm. On the other hand, the Bynum, Ingram, & Jaynes s.n. [Apr. 13, 1933], distributed as V. stricta, actually is V. rigida Spreng.

VERBENA STRIGOSA Cham.

Additional bibliography: Buek, Gen. Spec. Syn. Candoll. 3: 496.

1858; Moldenke, Phytologia 30: 170 (1975) and 36: 226. 1977.

Recent collectors describe this plant as a decumbent herb, 50 cm. tall, found it growing along roadsides, and report that the flowers "attract many bees". They have found it in flower in September and both in flower and fruit in December.

The corollas on Lindeman & Haas 2475 are described as having been "blue-purple (10PB6/6)", while on Lourteig 2143 they were "lilac". Handro says of the plant "planta do campo, formando grandes touceiras; flores roxo-azuis".

The Reitz & Klein 17616, cited below, was previously erroneously cited by me as V. hirta var. gracilis Dusén. The Dusén 242, distributed as V. strigosa, actually is V. lobata Vell.
